

# How to add time to relay protection

Calculate time overcurrent relay settings with IEEE & IEC standards. Learn IDMT relay formulas, TMS/TD settings and protection coordination.

In ETAP's protection coordination module, you can adjust relay settings directly on the curve plot. Drag the curve to any point and ETAP will automatically update the time dial.

Flasher and repeat cycle time relays are an easy way to add timed signals to your projects. You can make your systems smarter and work better with just a few changes.

Figure 1 shows how time-graded protection is achieved using overcurrent relays that have either inverse time or definite time characteristics.

The pickup currents are adjusted in such a way that the protection nearest the fault operates in a shorter time than the protection in the succeeding section towards the power source.

This page details the function of Definite Time Overcurrent Protection (ANSI 51), summarizes its operating principle, and explains the calculation method for its settings.

The document discusses setting the time dial or time multiplier setting (TDS/TMS) for protective relays. The TDS/TMS should be selected so that the relay does not maloperate under normal conditions but ...

Protection Coordination Principles Relay coordination is the process of selecting settings that will assure that the relays will operate in a reliable and selective way. In OC relays the coordination is based on ...

There are many types of protective relay functions, but this presentation will focus on the most common type, basic overcurrent device 50/51 (instantaneous and time overcurrent).

Time and current settings of IAC relays are made by selecting the proper current tap and adjusting the time dial to the number which corresponds to the characteristic required.

Because the protection areas of the interlocking-based protection concept are not overlapping and because they do not reach into the protection area of the next relays in the protection chain, a ...
